

5 I claim:

1. An orthotic device for providing motion to a user's limb through movement of a joint, said device comprising:

a strap;

an inflatable member connected to said strap and  
10 including an inflatable bladder, said inflatable member being spaced from said joint; and

a device operatively associated with said inflatable bladder for inflating and deflating said inflatable member such that as said inflatable member is inflated, said strap is placed in increasing  
15 tension so as to cause said joint to be moved.
